

Experiment No.3

Quick Sort

Aim - Implementation of quick sort.

Theory -

Algo -

0

- Make the right-most index value pitot.
- Partition the array using pilot value.
- Quicksort left partition recursively.
- Quicksort right partition recursively. 4.

Example -Consider the array: 50,23, 9,18,61,32

Make an element as pilot

- In our case low is 0 & high is 5
- Values at low & high are 50 & 32 & value of pilot is 32
- 2. Postiation the array on the basis of pilot.
- -In the postiation function, we start from the 1st elem
 - + compare it with pivot - Since 50 is greater than 32, we don't make any change + move on to the next element 23
 - Compare again with pivot. The array becomes 23, 50, 18, 61, 32
 - We move onto the next element 9 which is less tha 32, the array becomes 23, 9, 18, 50, 61, 32
 - Lastly, we swap our pivot with 50 so that it cor to the correct position.
- The main array after the 1st step becomes 23, 9,18 61,50
- Now list is divided into 2 parts. 4.
- Sublist before pivot element a)

b) Sublist after pivot element.
5. Repeat the desired element.

Repeat the steps for left & right recurrively. The final array thus becomes 9,18, 23, 32, 50,61

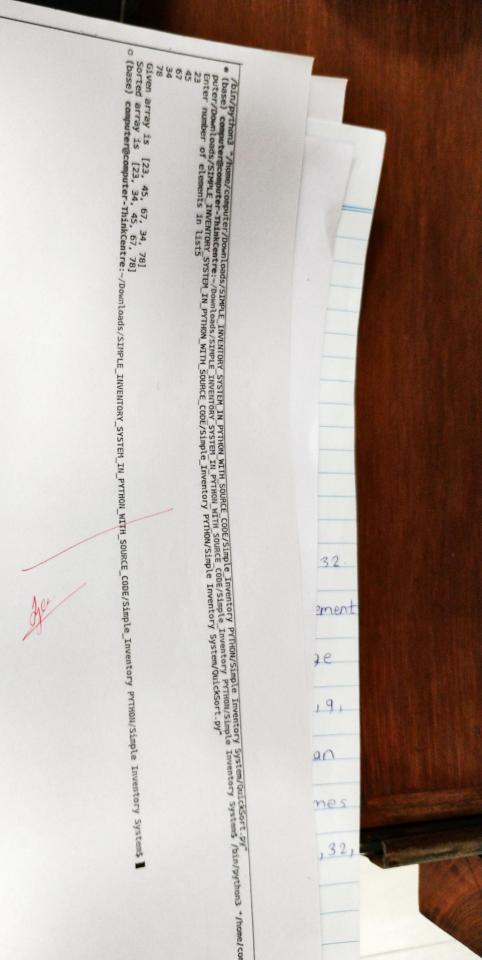

Time complexity -

Best Average Wrost 12 (n log (n)) | O(n log (n))

Conclusion -

Hence, we have successfully implemented algo & analysed the complexity.

```
# Python program to parform quicksort
def partition (array,low ,high):
  pivot=array[high]
  i=low-1
  for j in range(low ,high):
     if array[j]<= pivot:
       i=i+1
        array[i],array[j]= array[j],array[i]
  array[i+1],array[high]= array[high],array[i+1]
  return i+1
def quickSort(array,low,high):
  if low < high:
      pi=partition(array,low,high)
      quickSort(array,low,pi-1)
      quickSort(array,pi+1,high)
n=int(input("Enter number of elements in list"))
arr=[]
for i in range(n):
   b=int(input())
   arr.append(b)
print("Given array is ",arr)
quickSort(arr,0,n-1)
print("Sorted array is ",arr)
```

Experiment No. 4 Fractional Knapsack Problem

Aim - To implement fractional knapsack problem.

Theory -

Algo -

1. Node root represents the initial state of the knapsack, Where you have not selected any package.

-Total value = 0. The upper bound of the root node = M*M

- oximum unit cost.

2. Node root will have child nodes corresponding to the ability to select the package with the largest unit-cost. For ead node, your e- cal- whate the parameters.

3. In child nodes, you will prioritize branching for the rode having the larger upper-bond. The children of this node corresponds to the ability of selecting the next package having large unit cost.

4. Repeat step 3 with the note - for nodes with upper bor is lower or equals to the temporary maximum cost of

an option found you do not need to branch for that node 5. If all modes are bounched or cut off, the most expensiv

option is the one to look for.

THE PARTY OF THE P

Alg Example -

- The parameters of the problem are n=3; M=11,

-The packages: { i=i; w[i]=5; r[i]=10; { i=2; w[i] ; v [i] = 163; 1 = 3; w [i] = 10; v [i] = 283 -7 Light

weight but the values is also very light.

The algo will select [padrage 1, package 2) with a tot value of 26, while the optimal soll of the probler

is [package 3] with a total value of 28.

condusion -

Hence, we have successfully implemented also.

```
Activities Visual Studio Code -
                                                • • •
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   File Edit Selection View Go Run Terminal Help
